Quid pro Quo:

How Whole Genome Sequencing will enable international connection of food-, water- and human microbiology

– One Health through new methodology

*Joergen Schlundt
Professor Food Science
JIFSAN Conference
November, 2019*

A young boy with dark hair, wearing a white shirt with orange trim, is sitting at a white outdoor table. He is holding chopsticks and lifting a portion of yellow noodles from a white bowl. The background is slightly blurred, showing a bicycle and an outdoor setting. A yellow text box is overlaid on the right side of the image.

How safe is our food?

Food safety initiative
World Health Organization

NANYANG TECHNOLOGICAL UNIVERSITY | SINGAPORE

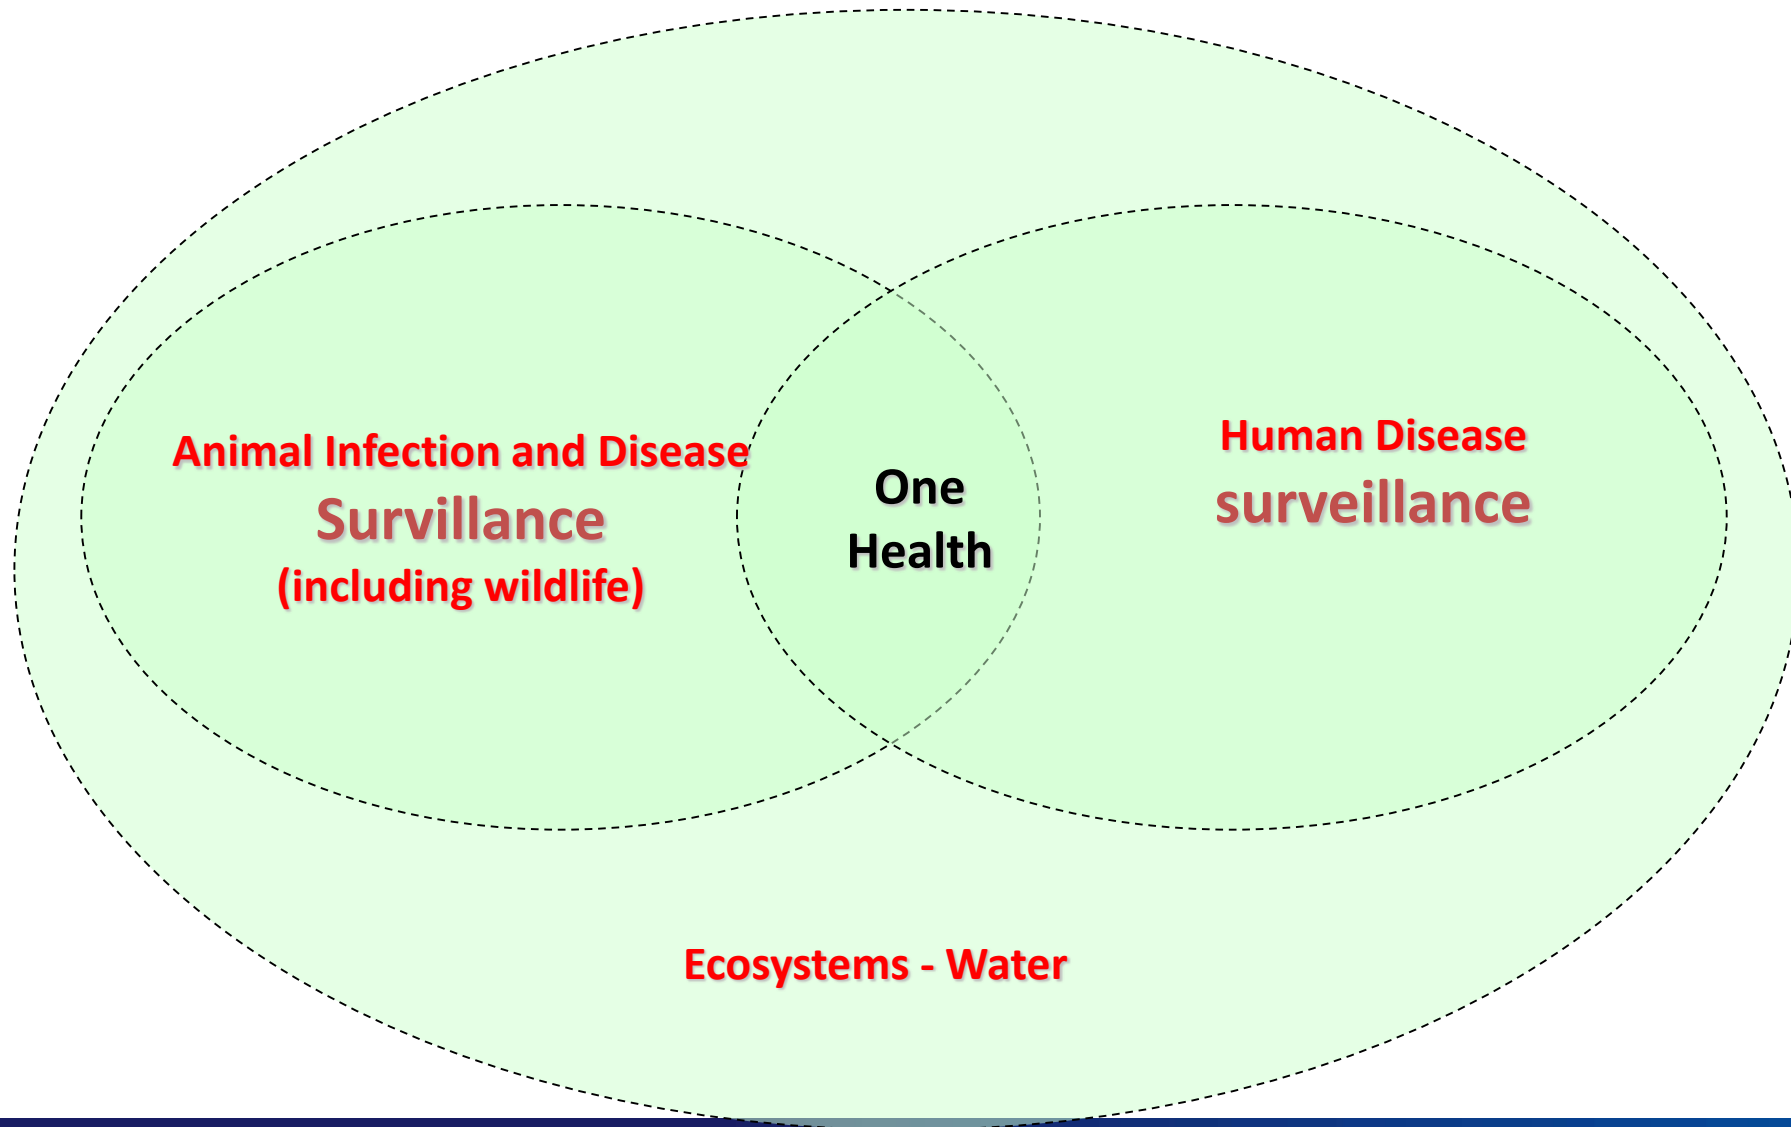

One Health Action?

One Health refers to “the collaborative efforts of multiple disciplines working locally, nationally and globally to attain optimal health for people, animals and our environment.”

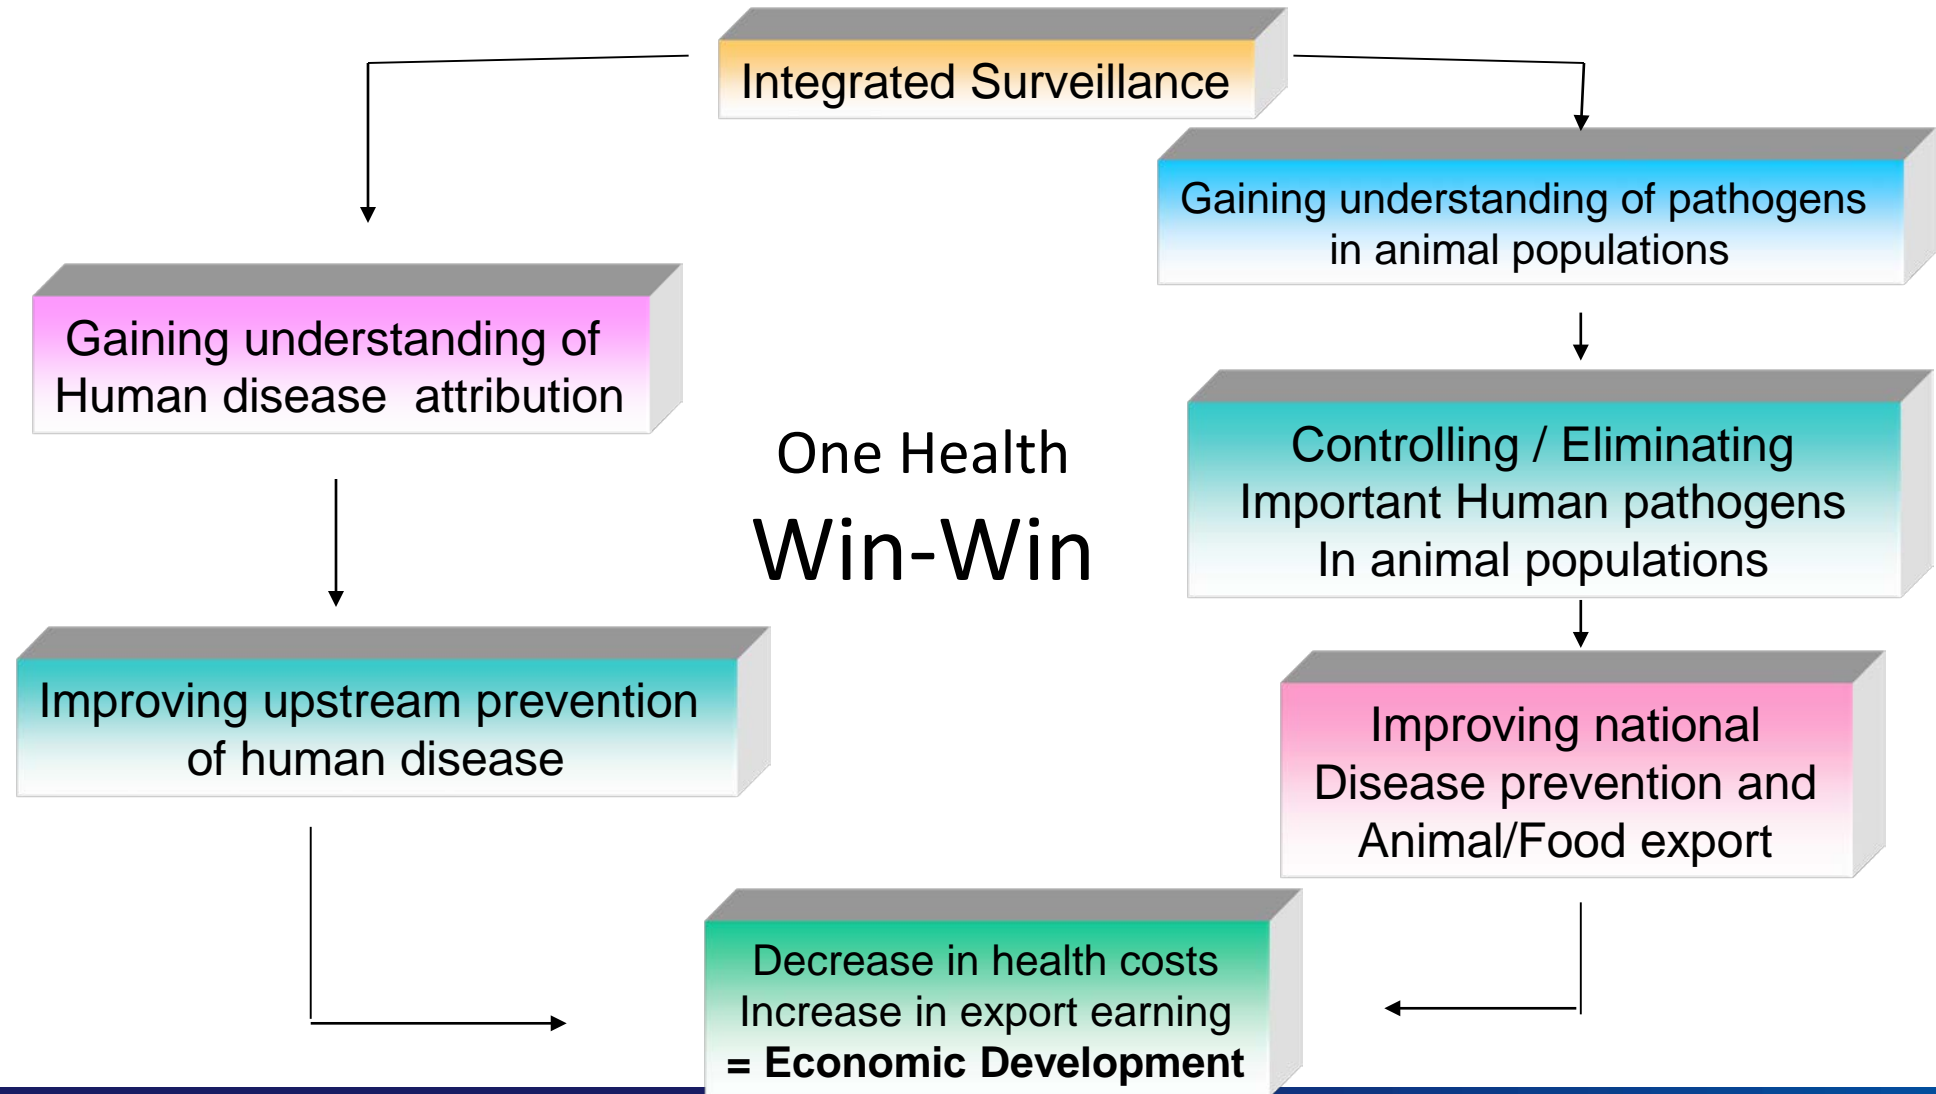

(from World Bank: PEOPLE, PATHOGENS AND OUR PLANET, Vol. 2: The Economics of One Health, 2012)

One Health: the interface in Infectious Disease Surveillance

One Health – Cost-Benefit – rel. to Food

One Health **sharing data and isolates**

We need to find mechanisms to share data and actual microorganisms (human/animal)

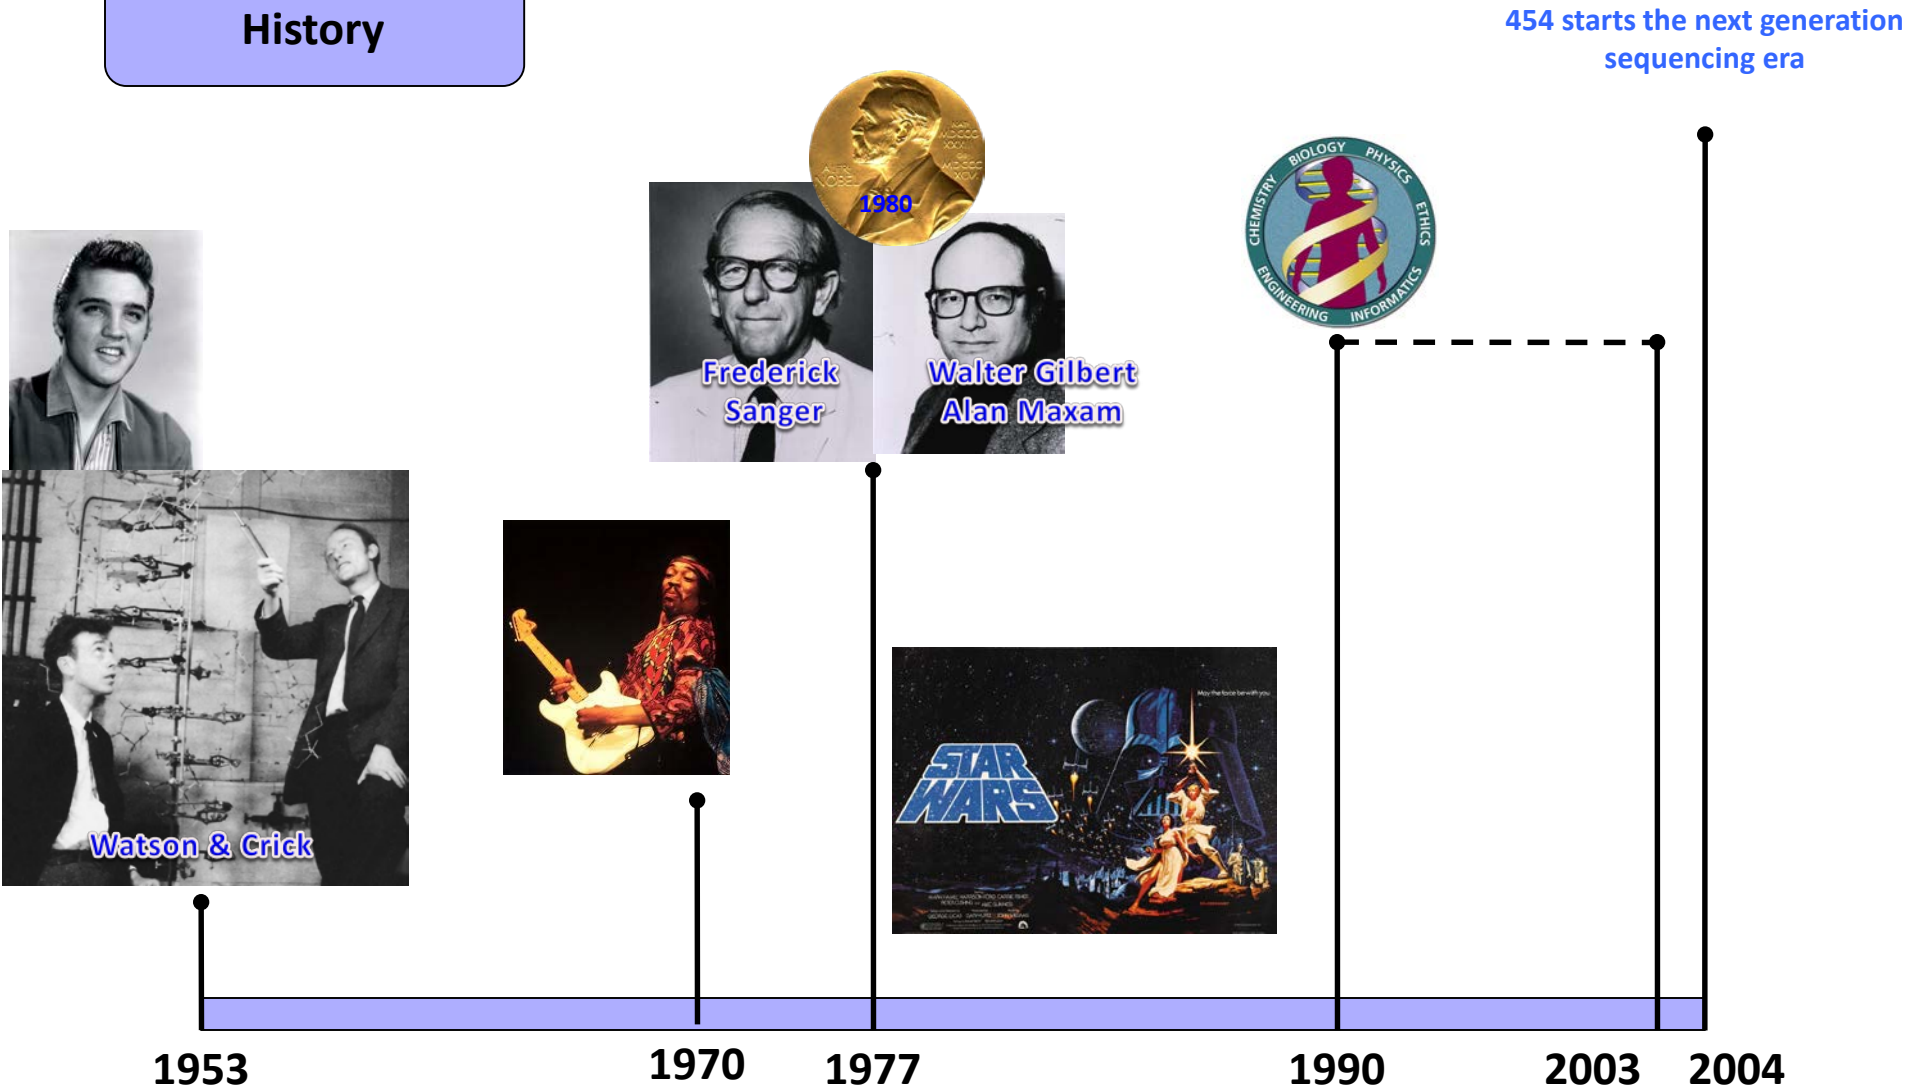

There needs to be clear benefit for all countries involved (industrialized countries -> help developing countries – as per SPS/WTO agreement)

In future, systems will provide dramatically different potential for pathogen characterization and pathogen tracking (global interactive database of total DNA sequencing data)

New Opportunities ?

History

454 starts the next generation sequencing era

Whole Genome Sequencing (WGS) - The next Milestone

Leeuwenhoek – 1676 – Bacteria/Microscopy

Pasteur– 1861– Proves Germ Theory
Invents pure culture technique (+ Koch)

2005 – Next Generation Sequencing (NGS) of microorganisms

Schwann– 1839– Cell Theory

Fleming– 1928– Discovers Antibiotics

NOTEWORTHY MILESTONES IN MICROBIOLOGY

**Some see new technologies and ask:
"Why?"**

**We see dramatic technological improvement, and ask:
"Why not?"**

(paraphrased from Robert Kennedy)

Global Microbial Identifier: GMI

A global system will enable two major lines of action:

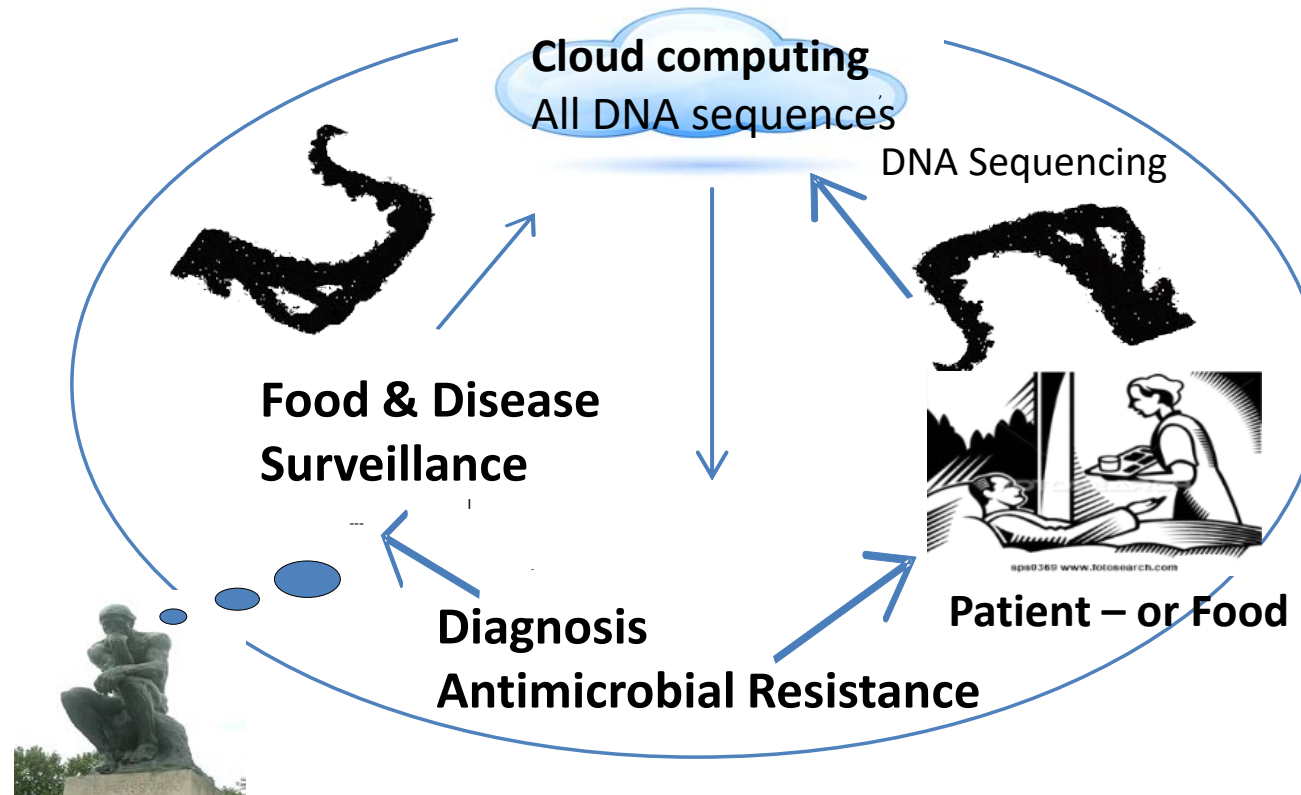

- Simple identification of all microorganisms in clinical (or other) settings, making redundant existing systems, and enabling reduction of total time for characterization down to typical time needed to obtain the original isolate
- A total database of unique sequences of all relevant microbiological strains globally, enabling real-time global surveillance of disease and pathogen developments

FUTURE Global Microbial Identifier: GMI

1st global tool to identify Microorganisms and Antimicrobial Resistance

Independent experts from 57 countries

Still:
Just an Idea !

Virus – Bacteria – Parasites Same - Same

www.globalmicrobialidentifier.org

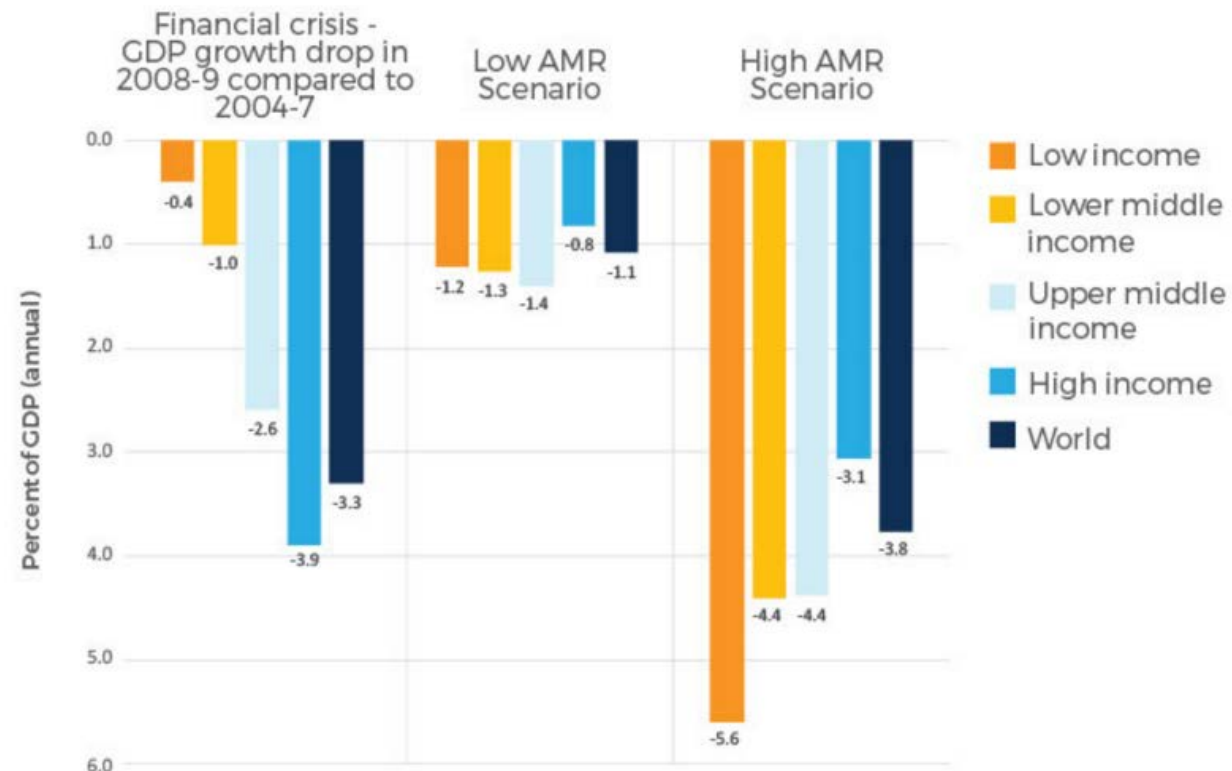

Global Microbial Identifier

The most important One Health issue: AMR - A global emerging threat

AMR WILL AFFECT THE POOREST COUNTRIES THE MOST

World Bank Group, March 2017, *Drug-resistant Infections – A threat to our economic future/*
Review on AMR, Dec. 2014

What is needed!

- Real-time sharing of data on occurrences of all infectious agents including AMR data
- Bioinformatic tools for automatically detections of related clusters in time and space
- Possibilities to observe trends in clones and species as well as resistance, virulence, and other epidemiological markers
- Ability to rapidly compare between all types of data; genomic, epi, explanatory variables

Now – we all know USA is the greatest !
(GenomeTrakr and Pulsenet just a few examples)

But sometimes other countries can contribute also

Especially - if you can get them to share their ...

SEWAGE

And although the idea is not from Norway – its close

You guessed it – its from **Denmark**

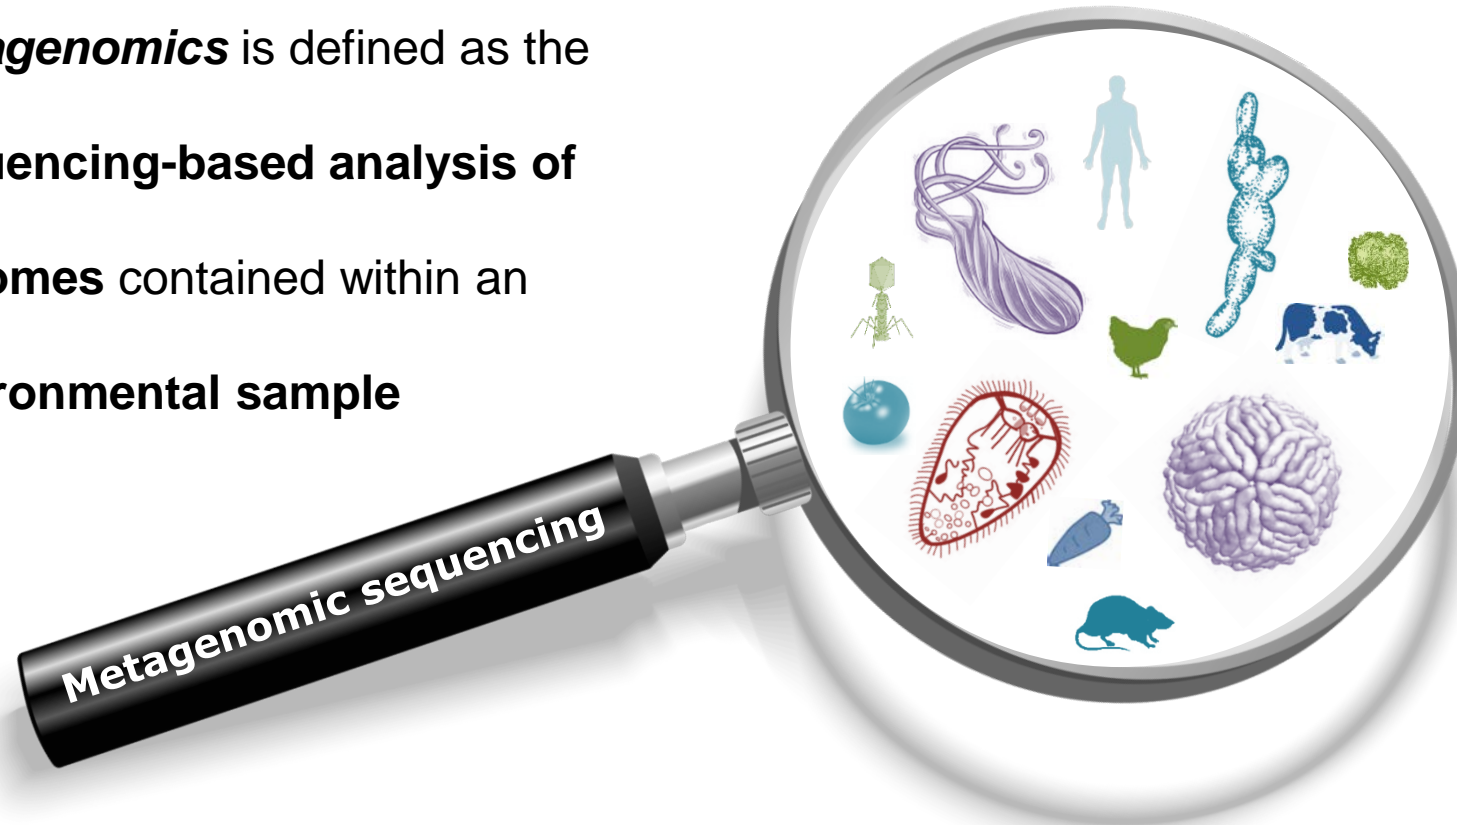

Monitoring large healthy populations using a metagenomic approach

Metagenomics – One technology that takes all

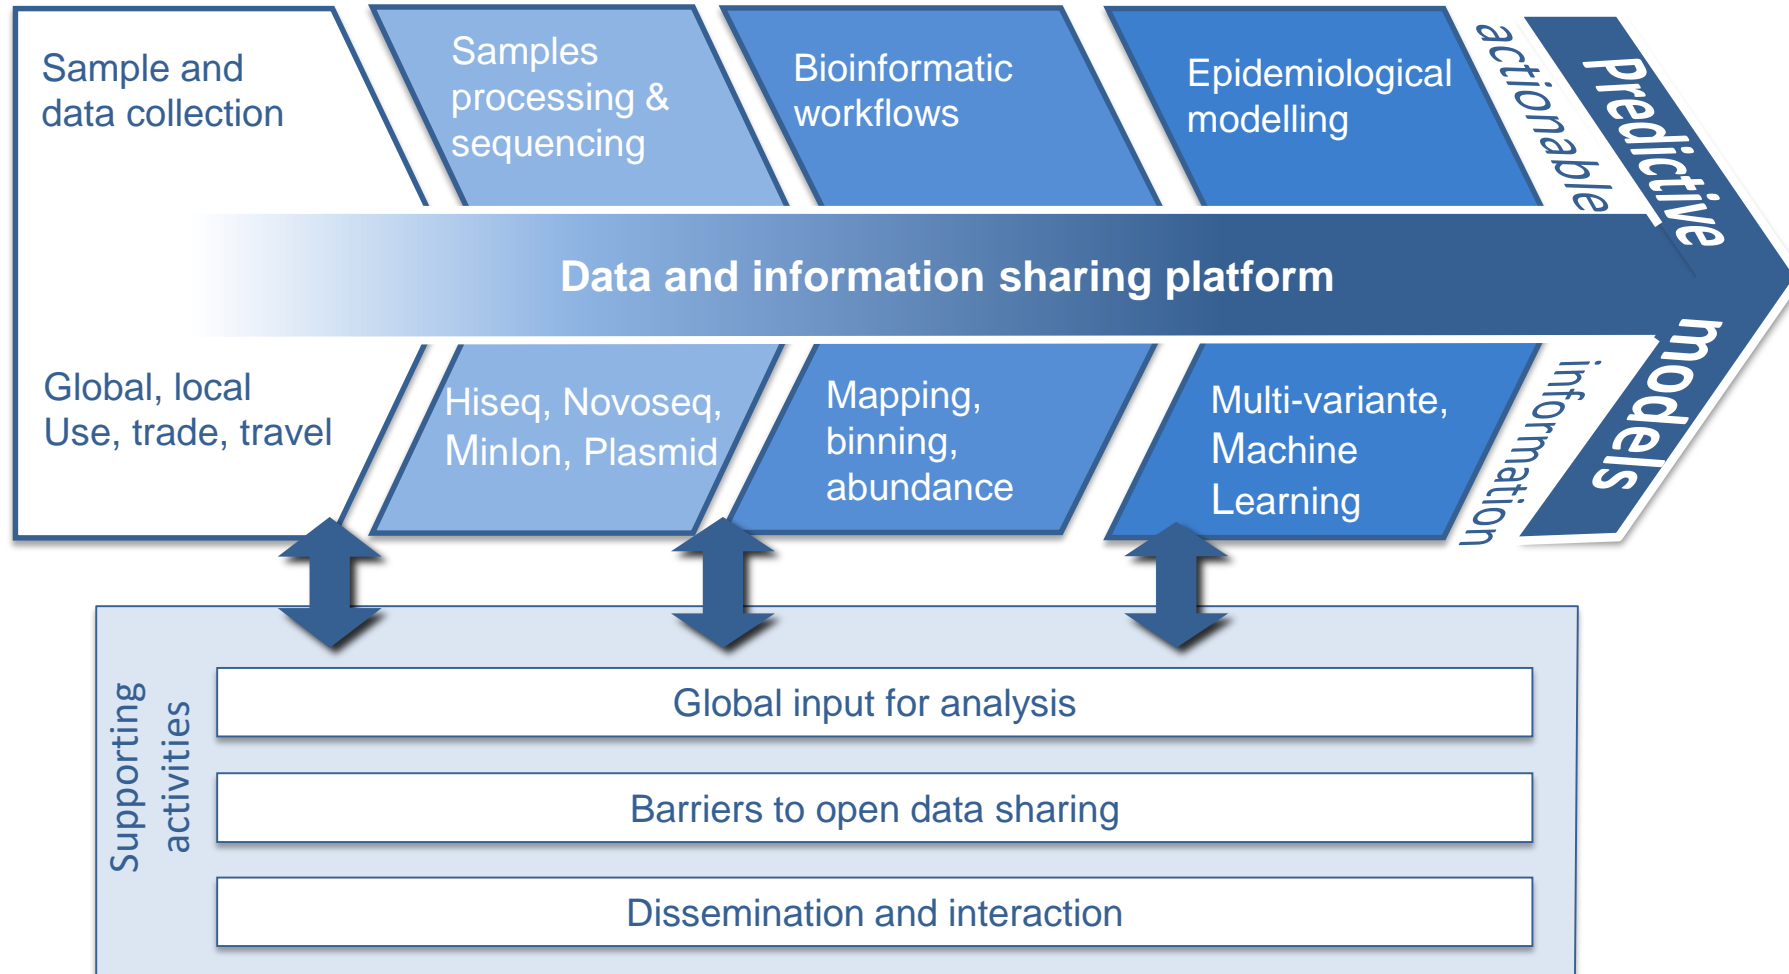

Metagenomics is defined as the
**sequencing-based analysis of
genomes** contained within an
environmental sample

WHO - NNF - EU/COMPARE - Global Sewage Surveillance project 2016

The structure of the project

Global sewage surveillance – 2016

AMR abundance per AMR class and gene

15 most common AMR genes –
Resistance genes depended on bacterial species

Global sewage surveillance – 2016

Applying artificial intelligence

Predicting global AMR significance for persistence in metagenomics sewage samples by applying artificial intelligence using explanatory variables, social demographics

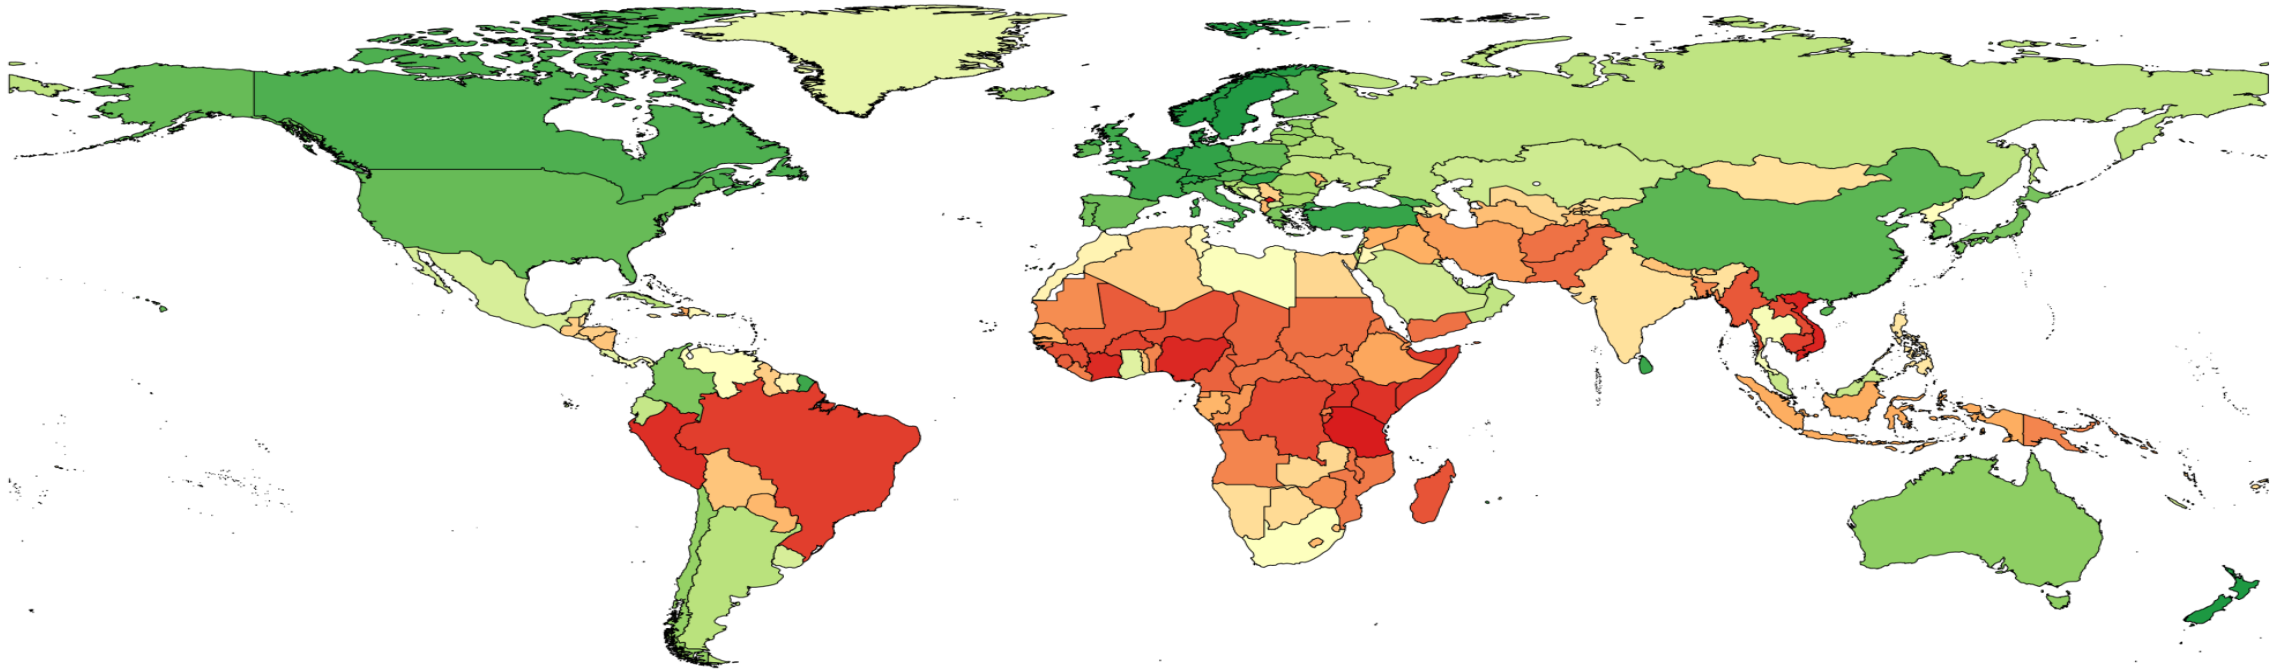

Database	Source
Antimicrobial usage	MIDAS, Xponent, ECDC
Human Development Index	World Bank
Health, Nutrition and Population	World Bank
GEMS/Food consumption database	World Health Organization
FAOSTAT Food security and agriculture	Food and Agriculture Organization UN
Global Livestock Production and Health Atlas	Food and Agriculture Organization UN
Antimicrobial resistance	Sewers, ECDC
Flight data	
Labor data	International Labor organization
Environment	CDIAC (Carbon Dioxide Information Analysis Center)

Global sewage surveillance – 2016

Predicting resistance

Map showing predicted prevalence of AMR

Developed by Frank Aarestrup

Global sewage surveillance – 2016

Important predictors

Predictors of higher AMR

- Mortality rate
- Informal employment
- Time to import
- Death, by communicable diseases and maternal, prenatal and nutrition conditions
- Risk of maternal death
- Open defecation
- Diarrhoea prevalence in children
- Risk of impoverishing expenditure for surgical care

Predictors of lower AMR

- Investment in water and sanitation
- Completeness of death reporting
- Grace period on external debt
- Educational attainment
- Number of surgical procedures
- Life expectancy at birth
- Number of Physicians
- Births attended by skilled health staff

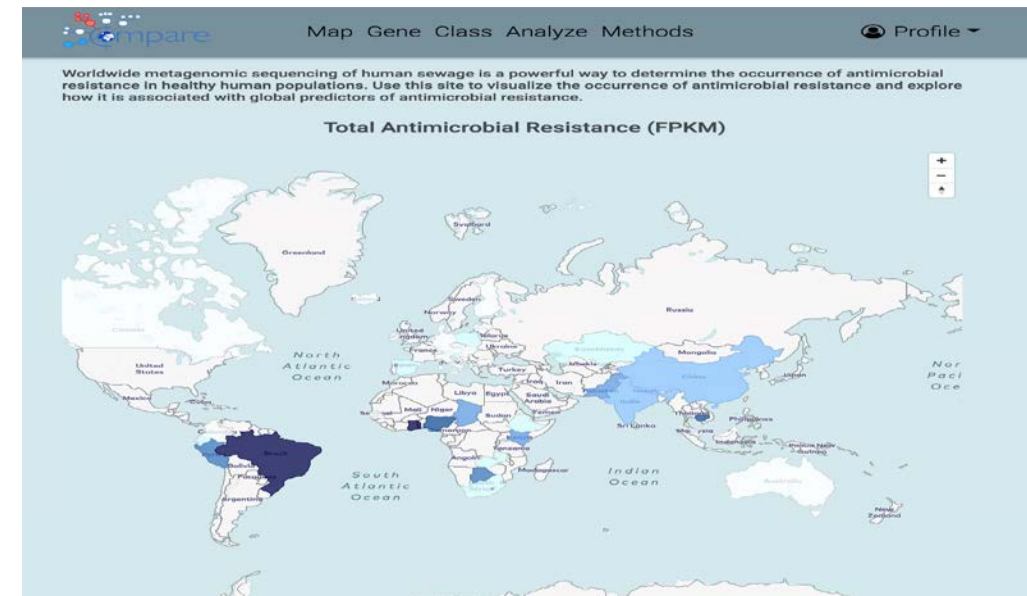

Global sewage surveillance – 2017 - 2018

On average 85 countries and 160 cities per round

- 620 samples in total
- App 100 countries

Collected by Rene Hendriksen / Jette Kjeldsen

Conclusions – sewage studies

- Metagenomic sequencing is potential superior to conventional and other genomic methods for quantification of AMR and pathogens
 - Powerful way to **determine prevalence and differences of all genes**
 - A realistic **alternative to conventional surveillance**
 - urban sewage is a proxy for clinical or individual human samples for population based surveillance?
 - Potential to use the same data for other surveillance topics
 - Some challenges still to overcome
- **Sanitation and health seems to be the main drivers of resistance** in healthy humans / usage in animals but other explanatory variables might also explain the occurrence of AMR
- Sustainability!

Future of Infectious Disease Control: *International – and National Human - Animal*

“Microbial molecular data are essential information for effective surveillance and proportional response to international Public Health Emergencies”
(EU/GESTURE Expert Meeting, 2009)

But we need same systems for:

- **Animal and Human strains**
- **Environmental, Food and Water strains**
- **National and International events**
- **Developing and Richer countries**

So, Why is WHO not driving this revolutionary potential for change: *too many players ??*

Food Safety

AMR

TB

Emergencies

Flu

Polio

Environment/Water

Sexual and reproductive health

Nagoya Protocol ?

However:

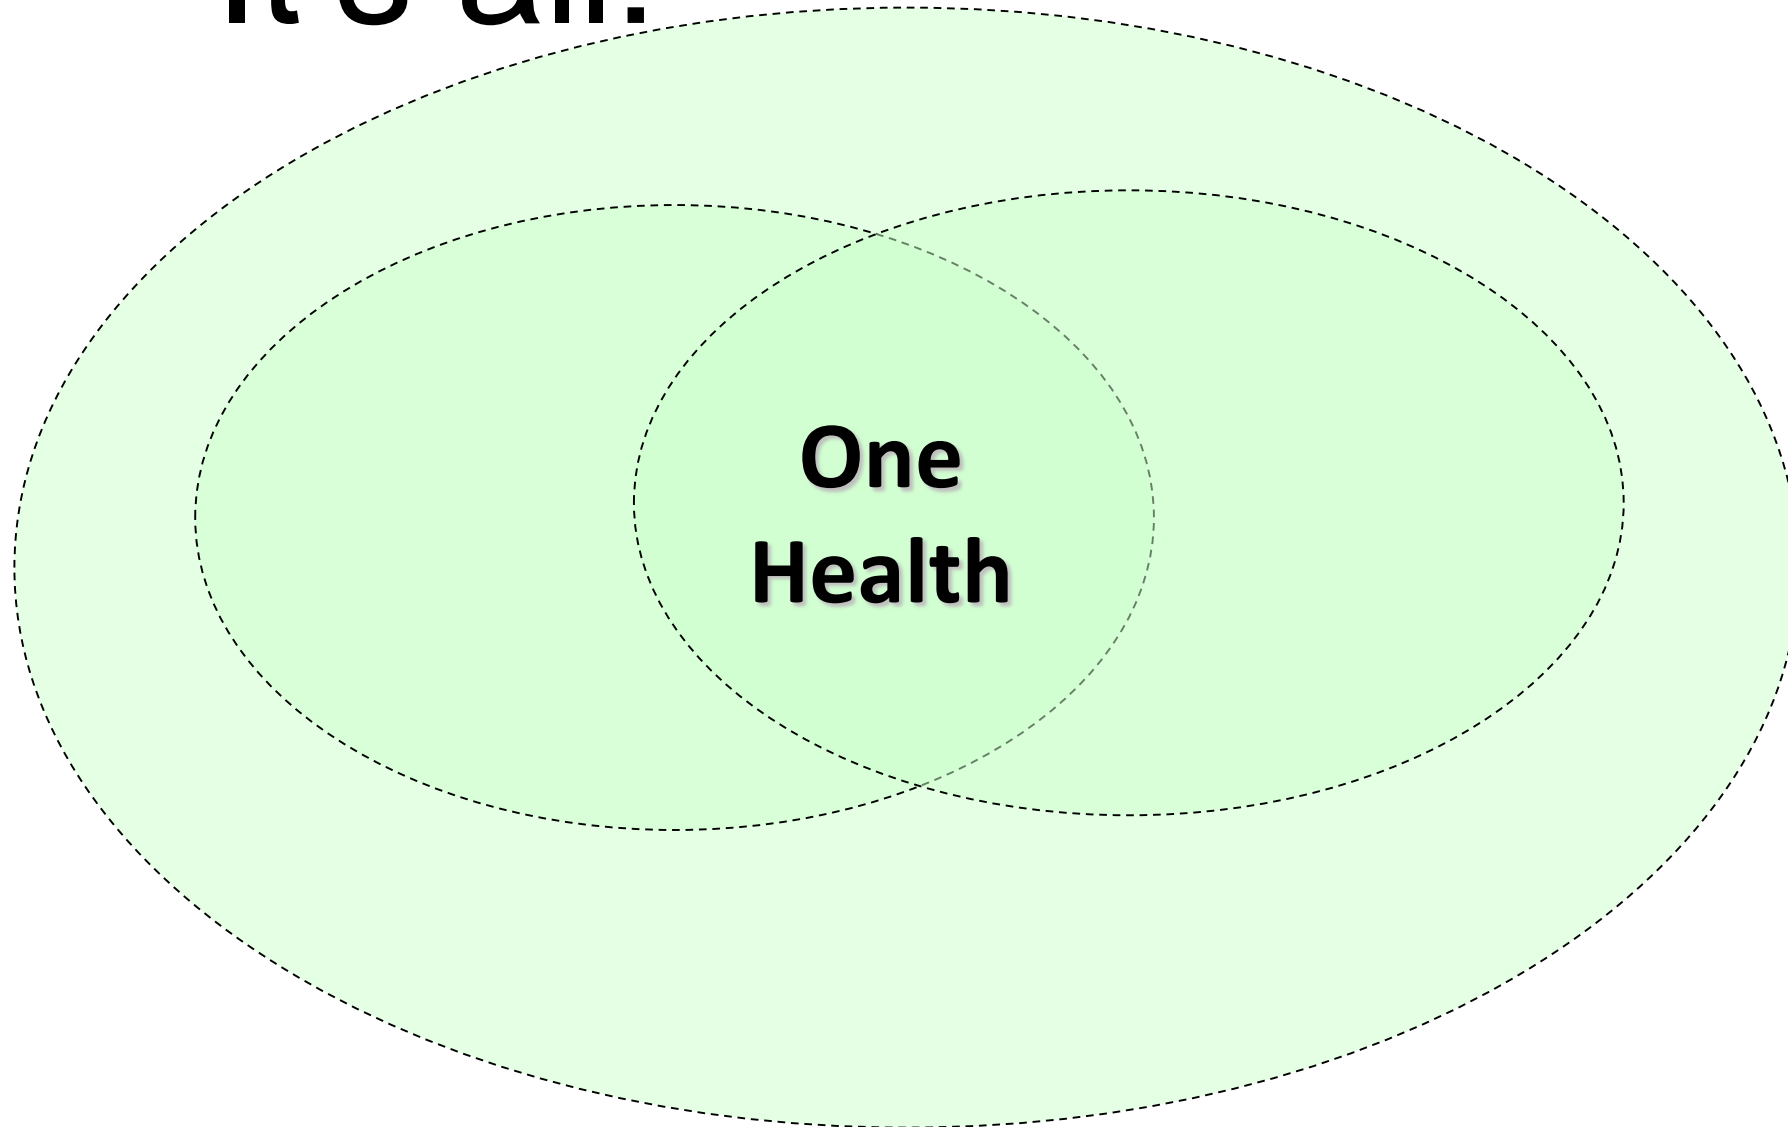

at World Health Assembly May 2020

There will be a Food Safety Resolution

Hopefully Member States will include strong statements about

the global use of NGS

It's all:

Continuous improvement

**Dare to change:
One Health!**

**Science
Independence
Resolve**
